**Transporting Hazardous Materials in a Vehicle**

**POLICY STATEMENT (OVERVIEW)**

The purpose of this policy is to assist University employees with compliance related to the DOT Materials of Trade (MOT) exception when transporting small quantities of hazardous materials. Certain hazardous materials transported by private motor carriers, for the purpose of direct support of their business (e.g. clinical and laboratory research) are exempt from most of the Department of Transportation (DOT) hazardous materials regulations, as long as they adhere to the requirements described in the MOT exception. Ultimately, by reviewing this policy, personnel should gain a better understanding of the MOT requirements and be better prepared to transport hazardous materials for University business.

**Note:** This policy and exemption does not apply to the relocation/movement of laboratories on or between New Mexico State University (NMSU) campuses, nor the relocation or movement of hazardous waste, Biological Substance, Category A materials or Radioactive Materials.

**DEFINITIONS**

**Hazardous Material:** any item or agent (biological, chemical, physical) which has the potential to cause harm to humans, animals, or the environment, either by itself or through interaction with other factors. For more information regarding individual hazard classes see 49 CFR reference in the table below.

**Materials of Trade (MOT):** Materials of trade are hazardous materials that are carried on motor vehicles for at least one of the following purposes:

1) To protect the health and safety of the motor vehicle operator or passengers. (e.g. insect repellant, fire extinguishers).
2) To support the operation or maintenance of motor vehicles/auxiliary equipment. (e.g. engine starting fluid, gasoline, spare battery).
3) Materials that must be carried by a private motor carrier to directly support a principal business that is not transportation. (e.g. academic and laboratory research, pest control, plumbing, painting). In other words, this exemption only applies to University employees transporting materials for University business, not commercial carriers (e.g. FedEx).

**Expansion Ratio:** the volume of a given amount of a substance in liquid or solid form compared to the volume of the same amount of substance in gaseous form, at a standard temperature and pressure.

**Reportable Quantity (RQ):** quantity of a [EPA listed material](#), that if released outside the facility, requires notification to NMSU Environmental, Health and Safety who will determine applicable reporting requirements to local, state and federal authorities.

**Note:** while the EPA list contains reportable quantities (RQs) for hazardous waste, at no time is hazardous waste allowed to be transported in private motor carriers. All departments must request Environmental Health and Safety (EH&S) to collect and properly dispose of their hazardous waste.
1) The packaging must be either the manufacturer’s original package or a package of equal or greater strength and integrity.

2) Packaging must be leak proof for liquids and gases and sift proof for solids.

3) Outer packaging is not required for receptacles such as cans or bottles that are secured against movement in cages, bins, boxes or compartments.

4) The package must be marked with a common name such as spray paint, or a proper shipping name from the Hazardous Material regulations, such as isopropyl alcohol, exempt human specimen, etc.

5) For Class 6, Division 6.2, Category B materials, OSHA requires that a biohazard label be placed on the outer or inner packaging.

6) Packages must be securely closed, secured against movement and protected against damage.

7) A non-bulk packaging other than a cylinder (including a receptacle transported without an outer packaging) must be marked with a common name or proper shipping name to identify the material it contains, including the letters "RQ" if it contains a reportable quantity of a hazardous substance.

8) A DOT specification cylinder (except DOT specification 39) must be marked and labeled as prescribed in 49 CFR 178 subpart C. Each DOT-39 cylinder must display the markings specified in § 178.65(i).

9) The operator of a motor vehicle that contains a MOT must be informed of the presence of the hazardous material (including whether the package contains a reportable quantity) and must be informed of the MOT requirements.

10) The aggregate gross weight of all materials of trade on a motor vehicle may not exceed 200 kg a. (440 pounds).

11) Hazardous materials used as refrigerant for specimens:
   - Cryogenic liquids in Dewar flasks, insulated cylinders, insulated portable tanks, insulated cargo tanks, and insulated tank cars, designed and constructed so that the pressure in such packaging will not exceed 25.3 psig under ambient temperature conditions during transportation are not subject to the regulations. The container must be marked as “liquid nitrogen”.
   - Dry Ice, when transported over the roadway, is not subject to the regulations; however, the container must be designed and constructed to permit the release of carbon dioxide gas in order to prevent a buildup of pressure that could rupture. Also, the package must be marked “Carbon dioxide, solid” or “Dry ice”.
   - Personnel should always try to use the least amount of refrigerant necessary to maintain the integrity of the materials during transport.

2 US Department of Transportation Pipeline and Hazardous Materials Safety Administration letter of interpretation Ref. No. 06-0131
RESPONSIBILITIES

1) NMSU Carriers must know the following:
   • General knowledge of MOT regulations
   • Quantity limitations
   • Packaging requirements
   • Marking and labeling requirements

2) MOT regulation does not require:
   • Shipping papers (shipper’s declaration)
   • Emergency response information
   • Placarding
   • Formal training or retention of training records

3) If a refrigerant is required for the shipment then:
   • The major safety concern is asphyxiation of personnel operating the vehicle due to
     displacement of oxygen by gaseous nitrogen (N₂) or carbon dioxide (CO₂). Even though the
     amounts of refrigerant being transported are small, the expansion ratios for these materials are
     quite large (expansion ratio liquid N₂ = 1:694 & solid CO₂ = 1:554) and they can quickly displace
     the O₂ in the environment. Although these particular materials are not regulated under the
     MOT exemption, they are still considered to be dangerous.
     • Materials must be labeled as either dry ice or liquid nitrogen and the carrier/operator must have
       knowledge of the materials that are being transported.
     • Materials should be transported in the trunk of the vehicle if possible. However, if not, then
       there should be adequate fresh air ventilation in the vehicle. This can be achieved by rolling the
       windows down during transport.
     • Materials must be in secondary containment, properly secured, properly vented, and there
       must be enough absorbent material to absorb all of the liquid, to include the refrigerant.

4) OSHA requires that there be a spill kit in each vehicle suitable for cleaning up the materials that are
   being transported. In general, this would consist of personal protective equipment (e.g. gloves, eye
   protection), absorbent materials, broom and dustpan, and bags to contain clean-up debris. If
   refrigerant is used during the transport, then the operator should have a pair of cryogenic gloves
   available in the vehicle.

5) All spills of materials in transport must be reported to NMSU EH&S immediately.

6) Hazardous materials must never be taken on any form of public transportation

7) Liability, Insurance Coverage and Use of Personal Vehicles:
   • It is strongly recommended that materials of trade be transported in a University owned vehicle.
     • If a University-owned vehicle is used to transport materials of trade according to this policy, an
       auto accident would be covered by the University’s vehicle insurance policy.
     • If a personal vehicle is used to transport MOT and an auto accident occurs, the employee’s
       personal auto insurance covers the damage up to the limits of their insurance policy then the
       University’s vehicle insurance policy should cover expenses on an excess basis. The employee’s
supervisor must authorize the use of a personal vehicle for this work duty.

- If an employee chooses to use their personal vehicle for transport they are strongly encouraged to discuss coverage scenarios with their own insurance carriers. The employee’s personal liability policy is primary, including applicable personal insurance deductibles to be paid by the employee.

- If the quantity of materials is large, categorizing them as a pollutant, the University’s vehicle insurance policy would not cover such a loss. (See RQ reference above). If you need to transport an RQ type of material contact EH&S prior to transport.

**SANCTIONS**

Improper transport of hazardous materials can lead to serious injuries, University property damage / loss, and personal property damage / loss. Injuries or accidents resulting from disregard for proper packaging, marking, or communication outlined by this MOT exemption document can result in inspection and citations by regulatory agencies, including DOT or OSHA. All penalties or fines are the responsibility of the University department in which the infraction occurred. Civil and criminal penalties may result from the improper disposal of hazardous materials.

HAZARDOUS MATERIALS TABLE FOR MATERIALS OF TRADE (MOT) EXEMPTION

In order to qualify for this exemption, the type of the material and the amount of the material are also regulated. A material of trade is limited to the following DOT hazard classes **ONLY**:

<table>
<thead>
<tr>
<th>Hazard</th>
<th>DOT Class</th>
<th>Maximum Quantity by PG (Packing Group From DOT Hazmat Table)</th>
<th>Examples</th>
<th>Definitions Found in: 49 CFR.173.XXX</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flammable Gasses</td>
<td>Class 2, Division 2.1</td>
<td>• PG I Limit = 220 lbs • PG II Limit = 200 lbs • PG III Limit = 220 lbs</td>
<td>Propane, Acetylene</td>
<td>115</td>
</tr>
<tr>
<td>Non-Flammable Gasses</td>
<td>Class 2, Division 2.2</td>
