

# 2025 Consumer Confidence Drinking Water Quality Report

**BE BOLD.** Shape the Future. | New Mexico State University | [nmsu.edu](https://nmsu.edu)

June 2026

## ESPAÑOL (Spanish)

Este informe contiene información importante acerca de su agua potable. Haga que alguien lo traduzca para usted, o hable con alguien que lo entienda. Si tiene preguntas, llama NMSU EH&S a 575-646-3327.

## CONSUMER CONFIDENCE REPORT - WHAT IS IT?

This report describes the water system operated by New Mexico State University. It provides details about where your water comes from, what it contains, and how it compares to standards set by regulatory agencies.

This report is a snapshot of last year's water quality (and may include previous years' results, where applicable), and meets requirements of the United States Environmental Protection Agency, under the Safe Drinking Water regulations.

## NEW MEXICO STATE UNIVERSITY PROVIDES SAFE DRINKING WATER

New Mexico State University provides high quality drinking water that is safe and has not exceeded any contaminant levels established by the United States Environmental Protection Agency's "Safe Drinking Water Standards" during the past year. In order to ensure the quality of our water, the Facilities & Services Department at New Mexico State University routinely samples the water supply and tests for over 125 contaminants. These contaminants include 10 heavy metals, 50 semi-volatile organic compounds (SOCs), 58 volatile organic compounds (VOCs), pH, hardness, iron, nitrates, fluoride, lead, copper, sulfates, total trihalomethanes, haloacetic acids and alkalinity. The tables located on pages two and three contain a listing of contaminants that were detected over the past year, as well as select non-detected

constituents. None of these contaminants exceeded "Safe Drinking Water Standards."

## STATE AND FEDERAL AGENCIES MONITOR WATER QUALITY

To ensure that tap water is safe to drink, the United States Environmental Protection Agency prescribes regulations which limit the number of certain contaminants in water that is provided by public water systems. Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water. All drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline (800-426-4791), or by visiting <https://www.epa.gov/groundwater-and-drinking-water/safe-drinking-water-information>.

To protect public health, the EPA and New Mexico Environment Department set maximum contaminant levels, maximum contaminant level goals and action levels for contaminants. Drinking water regulations may also require water treatment techniques.

## MICROBIOLOGICAL CONTAMINANTS

| Contaminant                | MCL                                                                                                                 | MCLG | Highest Detected Level | Sample Date | Likely Source of Contaminants                                                                                                                                                                                                               | Violations |
|----------------------------|---------------------------------------------------------------------------------------------------------------------|------|------------------------|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|
| Total Coliform Bacteria    | Presence of coliform bacteria in 5% of monthly samples                                                              | NA   | ND                     | Monthly     | Naturally present in the environment                                                                                                                                                                                                        | None       |
| Fecal Coliform and E. coli | A routine sample and repeat sample are total coliform positive, and one is also fecal coliform or E. coli positive. | NA   | ND                     | Monthly     | E. coli are bacteria whose presence indicates that the water may be contaminated with human or animal wastes. Human pathogens in these wastes can cause short-term effects, such as diarrhea, cramps, nausea, headaches, or other symptoms. | None       |

In addition to monitoring for bacteria, NMSU regularly monitors disinfectant levels in our drinking water distribution system. All 2022 results indicated disinfectant concentrations within allowable regulatory limits.

## RADIOACTIVE CONTAMINANTS

| Contaminant                            | Units   | MCL | MCLG | Range of Levels Detected | Highest Detected Level | Sample Date | Likely Source of Contaminants         | Violations |
|----------------------------------------|---------|-----|------|--------------------------|------------------------|-------------|---------------------------------------|------------|
| Beta/photon emitters                   | (pCi/l) | 50  | 0    | N/A                      | 5.5                    | 2025        | Decay of natural and manmade deposits | None       |
| Alpha emitters                         | (pCi/l) | 15  | 0    | N/A                      | 1.1                    | 2025        | Erosion of natural deposits           | None       |
| Combined radium                        | (pCi/l) | 5   | 0    | N/A                      | 0.6                    | 2025        | Erosion of natural deposits           | None       |
| Combined Uranium (Treatment Plant #14) | Ug/L    | 30  | 0    | N/A                      | 7.0                    | 2025        | Erosion of natural deposits           | None       |

## INORGANIC CONTAMINANTS

| Contaminant | Units | MCL   | MCLG | Range of Levels Detected | Highest Detected Level | Sample Date | Likely Source of Contaminants                                                       | Violations |
|-------------|-------|-------|------|--------------------------|------------------------|-------------|-------------------------------------------------------------------------------------|------------|
| Antimony    | ppb   | 6     | 6    | ND                       | ND                     | 9/20/2021   | Discharge from petroleum refineries; fire retardants; ceramics; electronics; solder | None       |
| Arsenic     | ppb   | 0.010 | 0    | 2 - 2                    | 2                      | 2024        | Erosion of natural deposits; runoff from orchards                                   | None       |
| Asbestos    | MFL   | 7     | 7    | ND                       | ND                     | 12/3/2012   | Decay of asbestos cement water mains; erosion of natural deposits                   | None       |
| Barium      | ppm   | 2     | 2    | 0.059 – 0.059            | 0.059                  | 2024        | Erosion of natural deposits                                                         | None       |
| Beryllium   | ppb   | 4     | 4    | ND                       | ND                     | 9/20/2021   | Discharge from electrical, aerospace, and defense industries                        | None       |
| Cadmium     | ppb   | 5     | 5    | ND                       | ND                     | 9/20/2021   | Corrosion of galvanized pipes; erosion of natural deposits                          | None       |

|          |     |     |     |    |    |           |                                                                                          |      |
|----------|-----|-----|-----|----|----|-----------|------------------------------------------------------------------------------------------|------|
| Chromium | ppb | 100 | 100 | ND | ND | 9/20/2021 | Erosion of natural deposits                                                              | None |
| Cyanide  | ppb | 200 | 200 | ND | ND | 7/13/2022 | Discharge from steel/metal factories;<br>discharge from plastic and fertilizer factories | None |

## INORGANIC CONTAMINANTS (continued)

| Contaminant             | Units | MCL | MCLG | Range of Levels Detected | Highest Detected Level | Sample Date | Likely Source of Contaminants                                                                                             | Violations |
|-------------------------|-------|-----|------|--------------------------|------------------------|-------------|---------------------------------------------------------------------------------------------------------------------------|------------|
| Fluoride <sup>(2)</sup> | ppm   | 4   | 4    | 0.48-0.48                | 0.51                   | 2025        | Erosion of natural deposits; Water additive which promotes strong teeth; Discharge from fertilizer and aluminum factories | None       |
| Mercury (inorganic)     | ppb   | 2   | 2    | ND                       | ND                     | 9/20/2021   | Erosion of natural deposits; discharge from refineries and factories; runoff from landfills; runoff from croplands        | None       |
| Nitrate (as Nitrogen)   | ppm   | 10  | 10   | 0.05-0.07                | 0.07                   | 7/13/2023   | Runoff from fertilizer use; leaching from septic tanks, sewage; erosion of natural deposits                               | None       |
| Selenium                | ppb   | 50  | 50   | ND                       | ND                     | 9/20/2021   | Erosion of natural deposits; discharge from mines                                                                         | None       |
| Thallium                | ppb   | m   | 0.5  | ND                       | ND                     | 9/20/2021   | Leaching from ore-processing sites                                                                                        | None       |

## DISINFECTION BY-PRODUCTS

| Contaminant            | Units | MCL | MCLG | Range of Levels Detected | Highest Detected Level | Sample Date | LRAA (Note 2) | Likely Source of Contaminants             | Violations |
|------------------------|-------|-----|------|--------------------------|------------------------|-------------|---------------|-------------------------------------------|------------|
| Chlorine               | ppm   | 4   | 4    | 0.9 - 1                  | 1.1                    | 2025        | NA            | Water additive used to control microbes   | None       |
| Total Trihalomethanes  | ppb   | 80  | N/A  | 0.82 - 34                | 27                     | 2025        | 0.29          | By-products of chlorinated drinking water | None       |
| Total Haloacetic Acids | ppb   | 60  | N/A  | 5.8 - 7.4                | 9                      | 2025        | 5             | By-products of chlorinated drinking water | None       |

## LEAD AND COPPER RULE

| Parameter | Units | Action Level (AL) | Range of Levels Detected | Highest Detected Level (Note 3) | Sample Date | Likely Source of Contaminants                                        | Violations |
|-----------|-------|-------------------|--------------------------|---------------------------------|-------------|----------------------------------------------------------------------|------------|
| Lead      | ppm   | 0.015             | 0 - 13                   | 4                               | 8/01/2025   | Corrosion of household plumbing systems, erosion of natural deposits | NA         |
| Copper    | ppm   | 1.3               | 0 - 0.56                 | 0.21                            | 8/01/2025   | Corrosion of household plumbing systems, erosion of natural deposits | NA         |

1) Fluoride is not added by NMSU.

2) Locational Running Annual Averages (LRAA's) are calculated quarterly for Total Trihalomethanes and Haloacetic Acids, based on four sampling locations.

3) There are no MCL's for copper or lead. Result reported is the 90th percentile value based on 10 samples; none exceeded the AL. Public Notification occurred in April 2022 for a 2021 non-sampling violation (NMSU had acquired 29 of 30 required samples; this was corrected in 2022).

## Important Drinking Water Definitions

### ADDITIONAL INFORMATION FOR LEAD

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. New Mexico State University is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <http://www.epa.gov/safewater/lead>.

We were required to provide a lead service line inventory to NMED. For a copy of the inventory please contact us at (575) 646-3327.

|------|------------|------|------------|

|       |                      |     |                              |
|-------|----------------------|-----|------------------------------|
| NA    | Not Applicable       | MFL | Millions of fibers per liter |
| ND    | Not Detected         | ppb | parts per billion (µg/liter) |
| pCi/l | Picocuries per liter | ppm | parts per million (mg/liter) |

## WHY ARE THERE CONTAMINANTS IN MY DRINKING WATER?

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline (800-426-4791).

The sources of drinking water (both tap and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity: microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife; inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban storm water runoff, industrial, or domestic wastewater discharges, oil and gas production, mining, or farming; pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm water runoff, and residential uses; organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems; and radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities.

To ensure that tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

## **DO I NEED TO TAKE SPECIAL PRECAUTIONS?**

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Water Drinking Hotline (800-426-4791).

**New Mexico State University provides high quality potable water that meets all applicable state and federal drinking water standards.**

In 2025 NMSU obtained potable water from four wells, all located on the Las Cruces campus (south of University Avenue and west of Espina Street). Each of these wells draw water from sediments within the Rio Grande fluvial aquifer. Groundwater disinfection is achieved by the addition of sodium hypochlorite, at each well, prior to distribution to NMSU facilities.

New Mexico State University recognizes that our water source not only supplies our campus community but the local Las Cruces community as well. We take pride in supplying our campus community with safe, great tasting drinking water.

NMSU Facilities and Services strives to ensure that not only the water we pump out of the ground is safe, but the source is protected in every way possible through ground-water protection measures.

A Source Water Assessment, conducted by the New Mexico Environment Department

**SOURCE WATER ASSESSMENT**

(NMED), is available by contacting the NMED Drinking Water Bureau at 505-476-8620.
