NMSU Aggie ID

-
1. Which contaminants do N-95 respirators protect against?
 - Asbestos
 - Chemical Vapors
 - Fine particulates
 - Oxygen deficient atmospheres
 2. To properly put on an N-95 respirator, you should: 1) read instructions; 2) place the respirator on your nose, mouth, and chin; 3) place straps against your head; 4) adjust the fit along your nose; and 5) _____.
 - Enter the area of concern
 - Seal check to test for leaks
 - Loosen respirator straps
 - Wash your hands
 3. What should you do to properly use and maintain your voluntary use respirator? Select all that apply.
 - Check your respirator or packaging for a certification statement or label.
 - Share your respirator with coworkers who may need one.
 - Read and follow the manufacturer's instructions.
 - Wash and reuse respirators when they become dirty.
 - Store your respirator properly to protect it from damage and contamination

I acknowledge that I have received and understand the information presented in N-95 Respirator Use Training, based on OSHA [29 CFR 1910.134 - Respiratory Protection](#). I will consult with my supervisor and/or EHS&RM for clarification or additional information. I have also read and understand the following: How to use N-95 respirator handout. Do not wear your respirator into atmospheres containing contaminants for which your respirator is not designed to protect against. For example, a respirator designed to filter dust particles will not protect you against gases, vapors, or highly toxic materials. Choose N-95 respirators certified for use to protect against the contaminant of concern. NIOSH, the National Institute for Occupational Safety and Health of the U.S. Department of Health and Human Services, certifies respirators. A label or statement of certification should appear on the respirator or respirator packaging; it will tell you what the respirator is designed for and how much it will protect you. Keep track of your respirator so that you do not mistakenly use someone else's respirator.
